

## BUSINESSMODELLER TRADE

Would you like to add your own specific data to existing data in AccountView? If so, you should choose the *BusinessModeller Trade* module.

### FOR WHOM?

For everyone who wants to add their own fields to AccountView without needing any programming knowledge.

### ADVANTAGES

- Considerable cost savings and flexibility, because you can add your own fields to AccountView at little cost and without knowledge of programming.

- High sophisticated functionality – new user fields immediately become an integrated part of AccountView.

- Certainty that your changes remain intact when you update AccountView.

- This is the module for adding your own specific fields to all the trade modules.

How would you like to be able to extend your product setup data with fields that are important to your organisation? With the *BusinessModeller Trade* module, you can add your own fields – to the setup data for products, for example. You could create a field to define the quality class and warranty periods of your products.

### ADDING FIELDS

You can extend AccountView using your own fields. This is useful if you want to store additional information. For example, you can add a field with information on colour and quality to your product file. You can even add 'list' fields so that you can select from a list of possible values. This speeds up your data input and also gives you the certainty of error-free record keeping!

### IMMEDIATE INTEGRATION

You can profit from the big advantage that new user fields immediately act like AccountView fields. For example, a new field immediately appears on a new tab; you can use it to execute filters and searches or to retrieve a report.
